

Abstract of the Disclosure:

A golf tee includes: a peg member inserted into the ground; and a flexible holding member engageably mounted on the peg member having a seat portion for holding a golf ball thereon, a coupling base for engaging the peg member therewith, and a plurality of links connected between the seat portion and the coupling base; whereby upon driving of the golf ball off the seat portion as struck by a club head, the flexible holding member may be temporarily biased for absorbing the striking force partially acting upon the golf tee and then the flexible holding member will be restored upright automatically to thereby be repeatedly reusable.
